Scientific Engineering of Distributed Java Applications

4th International Workshop, FIDJI 2004
Luxembourg-Kirchberg, Luxembourg, November 2004
Revised Selected Papers

Springer

FIDJI 2004 was an international forum for researchers and practitioners int- estedinthe advancesin,andapplicationsof,softwareengi neeringfordistributed application development. Concerning the technologies, the workshop focused on Java-related technologies. It was an opportunity to present and observe the latest research, results, and ideas in these areas. Allpaperssubmittedtothisworkshopwererevi ewedbyatleasttwomembers of the International Program Committee. Acceptance was based primarily on originality and contribution. We selected, for these post-workshop proceedings, 11 papers amongst 22 submitted, a tutorial and two keynotes. FIDJI2004aimedatpromotingascienti?cappr oachtosoftwareengineering. The scope of the workshop included the following topics: design of distributed applications development methodologies for software and system engineering UML-based development methodologies development of reliable and secure distributed systems component-based development methodologies dependability support during system life cycle fault tolerance re?nement, evolution and decomposition atomicity and exception handling in system development software architectures, frameworks and design patterns for developing d- tributed systems integration of formal techniques in the development process formal analysis and grounding of modelling notation and techniques (e. g. , UML, metamodelling) supporting the security and dependability requirements of distributed app- cations in the development process distributed software inspection refactoring methods industrial and academic case studies development and analysis tools The organization of such a workshop represents an important amount of work.
