

Functional and computer modeling: of dynamical and electrical systems

This book is a monograph and consist of two parts. The first part apply functional analysis and computer modeling of some problems of the dynamical systems, especially concerning the perturbation method in linear, nonlinear and stochastic dynamical systems. A number of theorems are suggested by the author, which are not only proven but also verified numerically applying computer modeling of some particular cases. In the second part are considered some problems closely connected with the practice of the electrical engineering. Here also two theorems were proven one concerning the control law of the microprocessor based control of induction motors, and the other in the field of optimization of complex systems. Most of the results are also verified numerically.

The first part can be used mainly by scientists, doctor students and mathematicians, while the second part is also useful for the master students and practitioner in the field of the electrical systems.
