

WAN Edge Data Center Designs: From DCI to DMVPN (Data Center Design Case Studies Book 1)

The first part of the Data Center Design Case Studies series describes typical data center WAN edge connectivity challenges, including: * Optimizing BGP routing on data center WAN edge routers; * Integrating MPLS/VPN network provided by one or more service providers with DMVPN-over-Internet backup network; * Building large-scale DMVPN network connecting one or more data centers with thousands of remote sites; * Implementing redundant data center connectivity and routing between active/active data centers and the outside world; * External routing combined with layer-2 data center interconnect. Design scenarios described in the book are based on dozens of consulting engagements solving real-life customer challenges.
