

Specification and Transformation of Programs: A Formal Approach to Software Development (Monographs in Computer Science)

Specification and transformation of programs is short for a methodology of software development where, from a formal specification of a problem to be solved, programs correctly solving that problem are constructed by stepwise application of formal, semantics-preserving transformation rules. The approach considers programming as a formal activity. Consequently, it requires some mathematical maturity and, above all, the will to try something new. A somewhat experienced programmer or a third- or fourth-year student in computer science should be able to master most of this material - at least, this is the level I have aimed at. This book is primarily intended as a general introductory textbook on transformational methodology. As with any methodology, reading and understanding is necessary but not sufficient. Therefore, most of the chapters contain a set of exercises for practising as homework. Solutions to these exercises exist and can, in principle, be obtained at nominal cost from the author upon request on appropriate letterhead. In addition, the book also can be seen as a comprehensive account of the particular transformational methodology developed within the Munich CIP project.

Balancing expressiveness in formal approaches to concurrency Specification and Transformation of Programs. Part of the series Texts and Monographs in Computer Science pp 189-262 Book Title: Specification and Transformation of Programs Book Subtitle: A Formal Approach to Software Development **A Formal Approach based on Fuzzy Logic for the Specification of** Specification and Transformation of Programs.
